***Abstract*—Write your abstract here.**

I. Introduction

Brazilian Jiu-Jitsu(BJJ) is a grappling martial art which consists of 1 vs 1 matches between fighters, in typical competitions fighters can win their matches via submissions, points, and various other methods. This means tracking fighter's gyms and results in a single spreadsheet can quickly lead to repeated data and inconsistent records.Therefore, the aim of this project is to tackle this problem by managing scenarios as a relational database that can answer questions such as who won a match,their method of victory, and how often each fighter wins
